PI:	Richard Horsley
Institution:	North Dakota State University
Address:	Department of Plant Sciences 166 Loftsgard Hall Box 5051 Fargo, ND 58105-5051
E-mail:	Richard_Horsley@ndsu.nodak.edu
Phone:	701-231-8142
Fax:	701-231-8474
Year:	FY2002 (approx. May 02– April 03)
Grant Number:	59-0790-1-073
Grant Title:	Fusarium Head Blight Research
FY02 ARS Award Amount:	\$ 65,366

Project

Program Area	Project Title	USWBSI Recommended Amount
BIO	Development of Environment-Friendly Fusarium Head Blight Resistant Transgenic Plants in Barley and Durum Wheat.	\$67,000
	Total Amount Recommended	\$67,000

 Principal Investigator

 Date

Project 1: Development of Environment-Friendly Fusarium Head Blight Resistant Transgenic Plants in Barley and Durum Wheat.

1. What major problem or issue is being resolved and how are you resolving it?

Resistance to FHB in barley and durum is limited, with only a few sources of partial resistance available for cultivar development. The development of transgenic barley and durum expressing antifungal and antitoxin genes has the potential to provide breeders with additional sources of resistance to incorporate into breeding programs. Single gene insertions have provided some protection, comparable to resistant checks, but disease and DON levels are still too high to provide complete protection. Our objective is to insert multiple antifungal and antitoxin genes into barley and durum, develop homozygous lines expressing the genes, and test their effects on FHB and DON. Antitoxin genes being used include *Tri101* and *Tri12*, and antifungal genes include chitinase and thaumatin-like protein genes.

2. What were the most significant accomplishments?

Additional greenhouse tests showed that *Tri101* and *PDR5* transgenic barley lines had disease levels comparable to the resistant checks CI4196 and Zhedar 2, significantly less than nontransgenic Conlon. Crosses between *Tri101* and *PDR5* lines have been advanced to the F₂ for selection on lines containing both genes. All *Tri101* and *PDR5* lines also have been crossed twice to Conlon and Lacey to develop lines without somaclonal variation.

Transgenic barley plants with three independent insertion events of a rice chitinase and rice thaumatin-like protein (tlp) were evaluated and advanced to the T₂ to develop homozygous lines. All three events produced the tlp as measured using western blots, but only one event produced the chitinase protein. Homozygous lines from all three events will be screened for FHB reaction this fall.

A total of 39 barley plants containing *Tri101* + tlp were regenerated. Preliminary western results indicate that the tlp gene is expressed in these plants. All six plants transgenic plants containing *Tri101* + chitinase show no expression of the chitinase gene by western analysis. All plants are being advanced for further testing and to determine the number of independent transformation events. A single transgenic containing *Tri12* + chitinase has been recovered so far and is under evaluation.

Transgenic durum also has been recovered, with 44 plants containing *Tri101* + tlp. Western analysis indicates tlp is expressed in some of these plants. Evaluation of progeny is underway.

Include below a list of the publications, presentations, peer-reviewed articles, and non-peer reviewed articles written about your work that resulted from all of the projects included in the grant. Please reference each item using an accepted journal format. If you need more space, continue the list on the next page.
