Project 1: *Economic Impact of Scab on Wheat and Barley: Update 1993-2001.*

1. What major problem or issue is being resolved and how are you resolving it?

The major problem that is being addressed in this project is to estimate the economic losses caused by Fusarium Head Blight (for 1993-2001) for U.S. wheat and barley producers. The problem is being resolved by estimating yield losses and quality-related price discounts by states and by region. Secondary economic losses in wheat and barley producing regions affected by scab are also estimated. GIS maps are developed to characterize the distribution of primary scab losses over time and space.

2. What were the most significant accomplishments?

Primary and secondary economic impact on hard red spring wheat (HRS), durum wheat, soft red winter wheat (SRW), and barley (from 1993 through 2001) has been completed for all major wheat and barley producing states in the U.S. A technical report has been completed, Agricultural Economics Report No. 538, Fourth coming July, 2004.

Include below a list of the publications, presentations, peer-reviewed articles, and non-peer reviewed articles written about your work that resulted from all of the projects included in the grant. Please reference each item using an accepted journal format. If you need more space, continue the list on the next page.

This project has generated two peer reviewed publications an MS thesis (new completion) and a technical report is new completion.
