We wish to acknowledge the support of the USDA Soft Wheat Quality Lab, Wooster OH, and the USDA Eastern Regional Small Grains Genotyping Lab, Raleigh NC.

INTRODUCTION: The objective of the Northern Uniform Winter Wheat Scab Nursery (NUWWSN) and the Preliminary Northern Uniform Winter Wheat Scab Nursery (PNUWWSN) is to screen winter wheat genotypes adapted to the northern portion of the eastern US for scab resistance. Breeders submit entries each also conducts the trial in inoculated and misted FHB nurseries within their programs. Data is then sent to the coordinator for summation and distribution. Public and private breeders submit lines using their own criteria for inclusion though all must be adapted. Entries vary in the degree of pretesting and selection and their purpose (germplasm, cultivars).

MATERIAL AND METHODS:

The locations that reported data and the traits assessed are listed in Tables 1, 2 and 3. The NUWWSN had 50 entries (46 lines & four checks, Table 4) from 9 programs, and we obtained phenotypic data on seven FHB-related traits from nine locations. The PNUWWSN had 36 entries (32 lines & four checks, Table 5) from 6 programs, and we obtained phenotypic data from seven locations. Cooperators collect replicated data and submit either plot level data or means to the coordinator. The means from individual locations are used in an analysis over locations. The genotype x environment interaction (GEI) term is the error and is used to calculate an LSD (0.05). The LSD value is used to determine if a particular entry mean is statistically equal to the lowest entry mean (such values are designated with an "l") or the highest entry mean (such values are designated with an "h") for each trait. Variance components were estimated using PROC MIXED from SAS considering entries and locations to be random. Several cooperators scored FHB Index using a 0-9 scale (0=no disease, 9=severe disease). This creates issues with combining IND data over locations. The reported F09 values were multiplied by 10 to provide an IND value.

HIGHLIGHTS

- Several cooperators reported very low levels of visual symptoms of FHB. This lead several to not collected spike symptoms (INC, SEV, or IND)
- ILURB and OHWOO did not collected IND due to low visual symptoms, but still harvested grain samples for FDK and DON. Both reported high average FDK while ILURB samples had low DON and OHWOO had high DON. Seems we need to always get FDK and DON regardless of IND.
- The frequency of the R allele at FHB1 was 0.59 among the 32 breeding lines in the PNUWWSN and 0.32 in the 46 NUWWSN breeding lines.
- A high percentage of lines in both tests had better DON and FDK than the “resistant” check “Truman”, or the moderate resistant check “Freedom”, while very few were worse than the susceptible PIO2545.

	FDK		DON	
	NUWWSN	PNUWWSN	NUWWSN	PNUWWSN
% Lines < Truman	33	47	28	50
% Lines < Freedom	48	75	59	88
% Lines > PIO2545	0	3	7	0

Table 1. Fusarium Head Blight and other traits assessed in 2022-2023 P+NUWWSN.

Code	Trait	Description
INC	Disease incidence	% of heads with at least one infected spikelets
SEV	Disease severity from field tests	% of infected spikelets in an infected head.
IND	Disease index	IND = (SEV*INC)/100 or F09*10
F09	FHB Index rated on a 0-9 scale	0= no disease, 9=very severe disease: 0-9 scores were multiplied by 10 to create values that were used in the IND analysis
FDK	Fusarium damaged kernels	Either a visual assessment of the percent infected kernels, or a percent of scabby seed by weight
ISK	Composite of head and kernel traits	ISK Index = 0.3 (Severity) +0 .3 (Incidence)+0.4 (FDK)
DON	DON (vomitoxin)	PPM of vomitoxin in grain
HD	Heading Date	Julian date when 50% of spikes have emerged from the boot
HGT	Plant Height	Height in inches from soil to top of spike of a typical plant

Table 2. Cooperators in the 2022-2023 P+NUWWSN.

Table 10. Summary of all FHB traits from the 2022-2023 PNUWWSN: "h" and "l" indicate means that are not significantly different from the highest (h) or lowest (l) mean in that column. "# R alleles for FHB1" indicates the number of resistance alleles at QTL *Fhb1*. PC1 scores are from principal component analysis using data from all traits.
