Selected transgenic barley lines in the cultivar “Conlon” that express combinations of glucanase, thauatin-like protein, chitinase and/or trichothecene transporter genes from rice, yeast and *Fusarium* species will be tested for Fusarium Head Blight (FHB) reaction for the fourth or fifth year in replicated field trials 2011. These lines had lower FHB and/or deoxynivalenol in previous years’ trials, including 2 lines that show 40% less DON than Conlon. Golden Promise barley lines expressing the anti-fungal gene gastrodianin developed in Iowa or hordothionin developed in Wisconsin were crossed twice to Conlon, and field tested for the first time in 2010. Lines were crossed a third time to Conlon in autumn 2010 because the dense spike characteristic of Golden Promise was still evident. Progeny from these crosses will be tested in the 2011 FHB nursery. For field containment, additional safeguards will be followed to prevent transgene escape or mixing with seed from the breeding and pathology projects.
